RETROFIT, DECONSTRUCTION & RECYCLING

BECOME ENVIRONMENTALLY
CONSCIOUS WITH SUSTAINABLE

At our current Brisbane retrofit project, we have designed around and over an existing footprint to short circuit lengthy and often very costly local authority approval processes. Throughout these retrofit journeys with our clients, we undertake a design-lead deconstruction and recycling process and strong measures to reduce waste.

Our approach to deconstruction is quite different to other companies. Instead of 30-tonne excavators and tip trucks, we simply have our specialists teams build in reverse - carefully dis-mantling managing the least amount of damage to materials, so as to re-use within or in association with the new design or other developments.

Since 2003, Sustainable has designed and applied particular interest in resource recovery. Our unique system reduces waste going to landfill from 45% to between 1 to 5%, equalling 98% total recycling of volume not weight.

This process means a cleaner and safer building site minimising material use and waste, and in turn leading to many savings from increased productivity, reduced council fees, better workplace health and safety and less possibility of neighbourhood disruption and contamination with waste and/or vermin.

In doing so, Sustainable reduces unnecessary waste and lowers the negative impact on the environment, but achieves great and long-term embodied energy results.

Sustainable by name, sustainable by nature.
